(December 2015) (More information on how and when removing this message template) the USB on-the-go USB logo on-the-go adapter for USB-B micro recharge ports of smartphone and tablet PC without dedicated USB-A USB port on -la-go (OTG USB or OTG only) is a specification first used at the end of 2001 which allows USB devices, such as tablets or smartphones, to act as a host, allowing other USB devices, such as USB flash units, digital cameras, mice or keyboards, to be attached to them. Using USB OTG allows devices to switch back and forth between the host roles and the device. A mobile phone can read from a removable media like the host device, but to appear as a USB Mass Storage Device when it is connected to a host computer. USB OTG introduces the concept of a device that runs both master and slave roles, A € each time two USB devices are connected and one of them is a USB OTG device, establish a communication link. The connection control device is called Master or Host, while the other is called slave or peripheral. USB OTG defines two roles for devices: OTG A-device and OTG B-device, specifying that it provides side supply to the connection and that it is initially the host. The OTG A-device is a power supply and a B-device otg is a power consumer. In the default connection configuration, the device A-acts as a USB host with the B-device acts as a USB device. The host peripheral mode can be exchanged subsequently using (HNP) host negotiation protocol. The initial role of each device was defined by which mini plug a user inserts into her housing. [1] Main a USB OTG configuration involves a plurality of standard USB devices uses a master / slave architecture; A host serves as a master device for the entire bus, and a USB device acts as a slave. If USB standard implementation, devices must take on one role or other, with computer generally set as a host, printers while (for example) normally work as a slave. In the absence of USB OTG, mobile phones often implemented Slave functionality to allow easy data transfer to and from computers. These phones, such as slaves, may not be easily linked to printers as also implemented the slave role. USB OTG addresses this problem directly. When a device is connected to USB bus, the master device, or the host, sets communications with the device service and provisioning handles (the host software allows or do the necessary management data such as file management or other desired type of data communication or Which allows devices to be considerably simplified with respect to the host; For example, a mouse contains very little logic and is based on the host to do almost all the work. The host controls all data transfers on the bus, with the devices in a €
